1. Project Overview

HFI Tool writes all interaction responses to your local disk. Your goal is to run a script to extract this raw session metadata and provide it for data restoration.

2. Workflow

The traceback process consists of downloading the script, executing it locally, and submitting the resulting archive.

2.1 Prepare the Environment

- **Locate the Script:** Download the traceback script, below, to your local machine.

```
hfi_traceback.py
```

- **Sanity Check:** Ensure your environment is ready to execute Python scripts.

2.2 Execution Steps

1. **Run the Script:** Execute the script on the laptop you used for tasks using the HFI Tool.

- a. Run the command

```
python hfi_traceback.py
```

2. **Locate the Output:** The script will produce a `.tar` file containing the recovered data.

- a. The output file will be created at `~/Desktop/claude-hfi-export-<hostname>-<YYYYMMDD-HHMMSS>.tar.gz`

- i. It falls back to `~/` if Desktop doesn't exist.

2.3 Submission

- **Upload:** Send the produced `.tar` file to the Revelo's Platform.

3. Frequently Asked Questions (FAQ)

▼ Is this task billable?

Yes, we have a 5 minutes maximum billable time. There is no bonus.

▼ What should I do if the script fails?

Please report any errors to the team immediately, specifying your operating system and setup.

▼ I can't find the file on Windows. Where the output is located?

Make sure you are running the script inside WSL, since that is where the data is located and where the file will be created.

▼ I worked on more than one machine. Do I need to run the script on all of them?

Yes. If you used claude-hfi on more than one machine, such as a desktop and a notebook, you need to run the script on both machines and send us both files.
